Summary

Senior Software Engineer with 14+ years of experience delivering scalable web applications, frontend infrastructure, and developer tooling. Built platforms from zero at an early-stage fintech, led the transformation of a health diagnostics product at Ro, and shipped tooling across HashiCorp's full product suite. Full-stack capable with deep frontend expertise. Currently building tooling for agentic engineering workflows.

Technical Skills

Languages & Frameworks: TypeScript, JavaScript, React, Next.js, Node.js

Infrastructure & Tooling: AWS, Vercel, Docker, GitHub Actions, Terraform, Webpack, Vite, CI/CD pipelines

Data & APIs: PostgreSQL, Redis, GraphQL

Testing: Playwright, Cypress, React Testing Library, Jest, Vitest

Practices: Design systems, component-driven development, Storybook, technical architecture & RFC authorship, cross-functional leadership, TDD, performance optimization, monitoring and telemetry (Datadog, Grafana)

Experience

Senior Frontend Engineer | Prime Financial Technologies | June 2023 – May 2025

Early-stage fintech using data science to underwrite SMB lending.

- Architected and built the entire frontend infrastructure from scratch — a Turborepo monorepo unifying Next.js, Astro, and Vite projects under a shared component library, enabling rapid iteration across multiple web properties
- Authored the technical RFC that migrated the flagship lending application from a single-page app to Next.js, improving SEO, initial load performance, and developer ergonomics
- Built a design-token-driven component system with Storybook, eliminating visual inconsistencies and cutting UI development time for new features by an estimated 40%
- Partnered with DevOps to containerize the Next.js deployment pipeline with Docker, reducing environment drift and streamlining staging-to-production releases
- Implemented a CI-integrated Playwright test suite against staging that caught regressions before production, enabling the team to ship daily with confidence
- Mentored full-stack engineers on frontend architecture, component design, and testing practices through pairing sessions and code reviews

Senior Software Engineer | Ro | December 2020 – April 2023

Led frontend development for Ro's diagnostics platform.

- Led the re-architecture of Ro's diagnostics experience from static PDF reports to a personalized, interactive health dashboard — driving a 200%+ increase in user engagement and 1.75x improvement in interaction rates
- Built a custom rules engine that modeled 35+ biomarkers across 7 blood tests with 8 combinatorial rule types, generating thousands of personalized result permutations — enabling healthcare professionals to define clinical logic without engineering support
- Developed a headless CMS integration that empowered non-technical medical staff to author and publish contextualized lab result interpretations, reducing content update

- cycles from days to hours
- Implemented enhanced RBAC to protect HIPAA-sensitive patient data across the diagnostics platform
- Collaborated with data science to surface personalized health insights and actionable next steps, improving patient comprehension and proactive care engagement

Senior Frontend Developer | HashiCorp | April 2019 – December 2020

Web platform team supporting documentation, marketing, and learning materials across HashiCorp's full product suite (Terraform, Vault, Consul, Nomad, Waypoint, Boundary, Packer, Vagrant).

- Built and maintained documentation infrastructure serving millions of monthly developer visits across 8 product lines, each with multi-version support
- Created an automated release workflow using GitHub Actions, Slack, and Asana — saving approximately 15 hours per month across the engineering team
- Developed a CI-powered dashboard that surfaced high-severity issues before release, measurably reducing production bugs and improving release confidence
- Built composable, AST-driven markdown plugins that codified documentation standards, ensuring consistency across distributed repositories and reducing editorial review cycles

Senior Frontend Developer | Blinker | September 2018 – March 2019

- Engineered a modular webcam capture component using browser APIs with feature parity to native apps, integrated with a custom ML microservice for real-time vehicle photo analysis
- Built a headless CMS integration (Contentful + webhooks) enabling non-technical stakeholders to publish marketing content independently

Current Projects

Fleet — Companion dashboard for AI coding agents

<https://github.com/pruett/fleet>

Building a multi-platform web UI for CLI-based AI agent harnesses (Claude Code, OpenCode, Codex). Fleet provides a web interface for monitoring and controlling agent sessions from any device — born from hands-on experience with agentic engineering workflows and the need to extend coding sessions away from the terminal.

Previous Experience

Senior Frontend Developer | Blinker | September 2018 – March 2019

Built browser-based vehicle photo capture with ML integration and a headless CMS (Contentful) for marketing content publishing.

Frontend Developer | Warby Parker | January 2016 – September 2018

Built frontend features for a high-traffic DTC e-commerce platform. Reduced frontend build times by ~150%, cutting 10 minutes per deploy. Increased e-commerce engagement metrics by 10-15% through A/B testing strategies.
